

SecantSTOR Sync

Securely access files from anywhere, any device or even while offline.

How often do you want to access a specific file you're working on only to realize you saved it on your other computer? Or worse yet, your team has spent hours working off a dated version of the file instead of the most recent version?

You don't need to walk around with a flash drive or email files to yourself. Not to mention the inconvenience but the security risks with this method can put your whole organization in jeopardy.

SecantSTOR Sync brings you the convenience of cloud storage and file synchronization without sacrificing security or control. With Sync, you can access files from anywhere, from any device, even when you are offline.

PRODUCTIVITY

No more emailing files to yourself to access data from a different device. With SecantSTOR Sync, you can access files from all of your Windows, Apple, and Android devices. There's no need to resave offline revisions or copy to a separate "sync" folder so your file and directory structure remains intact. You can also securely share files with others that are too large to send via email.

SECURITY

Built for business, SecantSTOR Sync utilizes 448-bit Blowfish encryption for files in transit as well as "at rest" on our private cloud servers. Sync accounts are integrated with your Active Directory so your password security is enforced. Synchronized data can be remotely wiped from mobile devices in the event of a security violation or departing employee.

COLLABORATION

Teams can easily and securely work together, whether from home, on the road, or at another facility. A group share provides access for team members to collaborate and access the same set of files from anywhere and from multiple devices. With collision detection and file revision history, team members are ensured of having the latest version of files as well as previous revisions.

IT CONTROL

SecantSTOR Sync puts synced files back in the control of your IT administrator, ensuring adherence to your company security policies.

Your Sync administrator can control:

- Storage usage/quotas
- Manage the type of file which can be synced
- Review log-in activity
- See which devices have been connected
- Manage team shares
- View the directory and file structure of synced folders
